coresuite eCommerce 2.0

coresystems®

Standard connection of SAP® Business One and online shops from ePages.

Data exchange.
coresuite eCommerce 2.0 allows you to safely exchange data concerning offers, clients and orders among ePages and SAP® Business One – manually, whenever changes occur, or in set intervals, depending on individual needs.

Multishop capability (function).
You would like to manage not one, but several shops with SAP® Business One? No problem. You can use the interface to send data from your product management system to several shops.

Multitaskmaster capability.
The support of more than one SAP® Business One mandates is guaranteed. It means: more than one shop per mandate can be connected even if more than one mandate has been installed on a server.

Language according to your needs.
ePages, SAP® and coresystems offer you different language options. So, it is entirely up to you to decide which languages to offer for your product management system and in the online shop.

Communication with guarantee.
In order to ensure that no loss occurs during data transfer, all changes in work queues are temporarily stored in a work queue and subsequently processed by the coresuite module. This means that there will be no problem even when extended data changes are made or the network breaks down.

Batch processing.
Save time and simultaneously synchronize selected product and client data. For that purpose, use the ePages batch processing, which can be easily managed, directly from the product management system.

Current client data.
Client data flows in both directions, too: updates in the product management system are directly communicated to the shop. When the client makes adjustments to client data in his client account in the ePages, the data is made available in SAP® upon consultation.

Product configuration.
Product data in SAP® Business One can be easily configured for the shop. Edit descriptions using the WYSIWYG editor or assign categories by Drag&Drop. This allows you to order pictures or additional PDFs with the utmost simplicity.

Product attributes.
All product attributes defined in ePages (for example, colour and size) can be transferred to SAP® Business One, to be there flexibly assigned to the products.

Orders.
Orders made in the shop are automatically exchanged between the shop and the product management system. Besides the specific order data, information on the selected shipment method and the payment option is also transferred, as well as eventual additional costs.

Stock.
Current stock and minimum stock are transmitted from the product management system to the shop with every item update and every transaction.

Flexible pricing.
Client specific pricing is directly sent from the product management system to the shop.

Transparency for the client.
Offer your client perfect service and let it gain permanent access to its orders' status. The status of a specific job order is processed by the product management system and subsequently transmitted to the corresponding ePages client account.

Sales promotion tools.
Accessory, comparison and cross-selling products are assigned to each individual product in the product management system.

Vouchers/discounts.
Discounts made in the shop are taken into account in SAP® Business One and shown in the order.

Advantages.
The fact that both processes and data are administrated in the same place helps reducing errors and saving in training expenses. Data in parallel systems are always synchronized and updated. You can improve client service due to a transparent order process and carry out individual adjustments whenever you want.
