

B2B Integration (EDI) and Intercompany for SAP® Business One.

Basis for data import and export.

coresuite connector offers a solid basis for all types of projects which mandatorily involve exporting or importing data from SAP® Business One. This makes it easy to add new documents or export all the information on a specific business partner as XML document. The export data can be exported in IDoc standard and imported into SAP® R/3.

Webservices.

The **coresuite connector** enables you to exploit external information sources more efficiently. For example, a process can be defined for updating currencies in your SAP® Business One system every day. **coresuite connector** reliably does this for you, thus completely avoiding the unpleasant task of copying indexes.

Dynamic definable business processes.

Business processes can be freely defined in XML files which means that they can be adjusted to individual needs. Its clear definition allows to conduct adjustments quickly and cheaply. The use of standard SQL, XML und XSLT technologies ensures that you get quickly acquainted with the system.

Connection to third party systems – import/export.

This solution enables to very simply and quickly export and import XML files. Data can be loaded into SAP® Business One from outside, which means that collaborators in charge of external service can process their client orders using an Excel sheet and subsequently load it into the system, using the **coresuite connector**.

Central management.

Due to its central installation in the SAP® Business One server, all configuration changes must be conducted only in one location and apply to all clients. As **coresuite connector** runs invisible at the background, no changes occur in the commonly known work environment.

Workflow optimization.

With **coresuite connector**, documents can be created without need for a specific order to that effect. For example, when a new client order is generated in taskmaster A, the corresponding purchase order can be automatically created in taskmaster B.

Master data synchronization.

The main purpose of **coresuite connector** is to adjust master data from different SAP® Business One task masters. Due to it being event-driven, changes always become immediately visible, so that there is no need to constantly synchronize data afterwards.

Event-driven functioning.

coresuite connector is driven by events. This means that it can immediately react to changes inside SAP® Business One. For example, if the address of a business partner is updated, a new XML file containing the changed data is immediately exported without you having to regularly export data.

Advantages.

This solution offers you limitless ideas and possibilities on how to make your workflow independent or more efficient. If you are unable to conduct a specific process with the supplied standard components, you can have **coresystems ag** programme it individually for you.
